EDUCATION

Farmingdale State College (SUNY) **May 2025**
B.S., Computer Programming and Information Systems | Major GPA: 3.32 | Dean's List, Fall 2024 *Farmingdale, NY*
Coursework: Systems Analysis & Design, Management Information Systems, Database Systems, Web Database Development, Information Security, Technical Writing.

Flatiron School **Expected Feb 2027**
AI & Data Science Immersive (8 of 12 courses complete) *New York, NY*
Completed: Python, SQL, Cloud Computing & Generative AI, Statistics, Regression, Machine Learning (scikit-learn).

WORK EXPERIENCE

Flatiron School **Feb 2026 – Present**
AI Engineering Apprentice (Paid) *New York, NY*
- Debugging API integrations and unfamiliar full-stack codebases (React, Next.js, TypeScript, Prisma, Supabase) to resolve bugs, ship features, and improve maintainability.
- Integrating OpenAI APIs with BAML to validate LLM responses against typed schemas before downstream use.
- Working in three-week Agile sprints on 4-person teams, defining MVP scope and planning releases from sprint reviews.

ECLARO (NYC Department of Homeless Services) **May 2023 – Apr 2024**
Residential Advisor *New York, NY*
- First point of contact for client questions and incidents at shelters housing 100 to 800+ clients; triaged issues in real time, resolved what was in scope, and escalated safety-related and complex cases to the DHS point of contact per protocol.
- Verified placement documents against intake notifications and kept admissions logs, sign-in/sign-out records, nightly rosters, and shift-transition reports accurate across a rotating, multi-agency staff.
- Ran walkthroughs, inventory checks, and nightly roster checks, flagged discrepancies and shortages to the DHS point of contact, and briefed the next shift on every open issue.

PROJECTS

StarChart — Comics Discovery App **In development**
Python, TypeScript, Next.js, React, SurrealDB, SQLite, Clerk, Tailwind CSS, pytest
- Designing a search app for comic fans to find stories by plain-language description (such as the first time Batman met the Joker) and see which issues contain them, matching on story and issue metadata with semantic search (embeddings).
- Wrote Python scripts that cut the Grand Comics Database dump down to six major U.S. publishers (6.75 GB to 832 MB) and normalize its records into StarChart's own entities in SurrealDB; a re-run updates records instead of duplicating them.
- Seeded the database from the Grand Comics Database dump rather than importing records from its API in the background as users search, to reduce latency and avoid data migrations from the still-growing API.
- Wrote a product document (mission, problem, feature set) and a technical decision record for the project.

Job Finder — Automated Job Search Pipeline **Oct 2026**
Python, GitHub Actions, Notion API, Exa API, YAML, pytest
- Designed a Python app that runs daily on GitHub Actions, pulling entry-level NYC and US-remote postings from six applicant-tracking-system APIs (Greenhouse, Lever, Ashby, SmartRecruiters, Recruitee, Workday) into a Notion table.
- Used these APIs directly instead of LinkedIn or Indeed, to avoid their posting delays and find postings not listed there.
- Normalized postings to one data model, filtered with YAML rules (location, seniority, years of experience, posting age, pay) set from junior-level constraints; skips duplicates, marks closed postings, and reports why jobs were dropped.

TeleShow — Movie & TV Discovery Web App | GitHub **Feb 2025**
React, Flask, Python, Firebase Firestore, TMDB and Watchmode APIs
- Integrated the TMDB and Watchmode REST APIs into a Flask backend; found that the tmdbsimple wrapper sometimes returned no watch-provider data and replaced that call with a direct HTTP request.
- Designed the Firestore data model for watchlists, followed media, TV progress, calendar entries, and learned interests.
- Designed recommendations around a user's chosen streaming platforms, so they only see titles available on their services.
- Optimized with threaded lookups, caching, a sleep-and-retry limiter around TMDB calls, and Flask-Limiter on endpoints.

TECHNICAL SKILLS

Analysis: Technical documentation, data modeling, REST API debugging, incident triage and escalation, Agile sprints
Data: SQL, Firebase Firestore, Supabase
Languages & Frameworks: Python, TypeScript, JavaScript, Java, HTML, CSS, React
Tools: Git, GitHub, GitHub Actions, pytest, BAML
